The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply							
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Art Unit: 2686

DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-6, 8-10, are rejected under 35 U.S.C. 103(a) as being unpatentable over Kallio (US Patent Number 2002/0147008 A1) in view Bridgelall (US Publication 2002/0085516 A1).

Regarding claim 1, Kallio teaches a method of managing mobility of a mobile station across an 802.xx wireless local area network (WLAN) and a wireless wide area network (WWAN) in which a mobile switching center (MSC) has been provisioned to act as a serving MSC for the WLAN (pages 2-3, section 0024, the 802.11 is IEEE standard for WLAN), comprising:

a mobile station send handover access WWAN to the WLAN (page 6 section 0050);

the serving MSC for the WLAN causing the WWAN to recognize that the mobile station is registered with the serving MSC (WMC, 220) page 4 section 0031) for the

WLAN and that the mobile station is no longer served by a prior MSC (112) (see figure 2, page 6 section 0050);

the mobile station communicating to entities outside of the WLAN by communicating with the WLAN via a WLAN protocol and the WLAN communicating with the WWAN via the serving MSC (WMC) or the WLAN (page 4 section 0036). Kallio does not specifically mention in response to the mobile station issuing a registration request to the serving MSC (WMC) for the WLAN; and the mobile station detecting the RF energy of the WLAN and validating its ability to be a member of the WLAN. However, Bridgelall teaches a method of a dual mode Radio, which enables a user to seamlessly switch between a WLAN and a WWAN or vice-versa while roaming in either network area, and a mobile initiates communication via by issuing a registration request to the serving MSC for WLAN (page 4 section 0038), in response to the mobile station issuing a registration request to the serving MSC for the WLAN (page 6 section 0050). The Radio essentially consists of two Radio systems in parallel. A WLAN Radio section comprises an RF section including a base band signal digitization section linked to a RAM and a digital to analog converter 910 providing Voice over Internet Protocol output and also serving as a microphone (page 6 section 0052). The mobile tunes to an 802.11(b) channel and listens for a beacon frame having a Service Set Identifier (SSID) with which the station wishes to join. After the mobile unit detects the beacon (detects RF), the mobile can begin negotiating a connection by proceeding with authentication and association process as will be described hereinafter (page 5 section 0044). Therefore, it would have been obvious to

one of ordinary skill in the art at the time of the invention to combine the above teaching of Bridgelall with Kallio, in order to provide a mobile station that passively scans WLAN network by listening regularly scheduled beacons sent out by AP access point, and automatically switches between the two substantially different networks

Regarding claim 2, Kallio inherently teaches a method wherein the mobile station issues a registration request by ending a SIP Register message on the WLAN via a WLAN air interface protocol to request registration therein (page 4 section 0033), and the WLAN communicates the registration request to the MSC serving the WLAN (page 6 section 0053).

Regarding claim 3, Kallio teaches a method further including the MSC serving the WLAN sending a de-registration request to an MSC that previously served the mobile station (page 4 section 0036).

Regarding claim 4, Kallio teaches a method wherein the MSC (WMC) serving the WLAN sends a registration notification message to an HLR to update the WWAN with location information of the mobile station, and wherein the HLR communicates with a prior MSC to cancel service thereat of the mobile station (page 5 sections 0040).

Regarding claim 5, Kallio teaches a method wherein the MSC (WMC) serving the WLAN sends an update location message to an HLR to update the WWAN with

Application/Control Number: 10/052,127

Art Unit: 2686

location information of the mobile station, and wherein the HLR communicates with a prior MSC to cancel service thereat of the mobile station, and wherein the HLR communicates with the MSC (WMC) serving the WLAN to insert thereat the mobile station as a subscriber for service (page 5 section 0040).

Regarding claim 6, Kallio teaches a method wherein a mobile station detects the WLAN and validates its ability to be a member of the WLAN while the mobile station is participating in a call using a WWAN air interface protocol (page 6 section 0050) and in response thereto, the source MSC analyzing the message, establishing itself as an anchor MSC, and establishing communication channels with a target MSC servicing the detected WLAN (page 6 section 0052); and the WLAN forwarding messages to the target MSC serving the WLAN via IP communication; and the target MSC relaying those communication to the anchor MSC (page 6 section 0052).

Kallio does not specifically mention sending a message to a source MSC that is servicing the call that a handoff is desired; and the mobile station beginning communication with the WLAN via a WLAN air interface; and the step of a mobile station detecting the RF energy of the WLAN and validating its ability to be a member of the WLAN. However, Bridgelall teaches a the step of a mobile station detecting the RF energy of the WLAN and validating its ability to be a member of the WLAN (page 5 section 0044), and mention sending a message to a source MSC that is servicing the call that a handoff is desired; and the mobile station beginning communication with the

WLAN via a WLAN air interface (page 4 section 0038). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to combine the above teaching of Bridgelall with Kallio, in order to provide a mobile station that passively scans WLAN network by listening regularly scheduled beacons sent out by an AP access point and automatically switches between the two substantially different network.

Regarding claim 8, Kallio teaches a method further including a mobile station determining that it should communicate via a WWAN air interface protocol and not via a WLAN air interface protocol (page 6 section 0053); the mobile station issuing a registration request to the WWAN via a base station controller (BSC) and MSC corresponding to a location in which the mobile station resides (Page 6 section 0052); the corresponding MSC causing the WWAN to recognize that the mobile station is registered with the corresponding MSC and that the mobile station is no longer served by a prior MSC, which served the mobile station when it was communicating according to a WLAN air interface protocole (page 6 sections 0057, 0058).

Regarding claim 9, Kallio teaches a method wherein a mobile station determines that it should communicate according to a WWAN air interface protocol while the mobile station is participating in a call under a WLAN air interface protocol and in response

thereto sending a message to a source MSC (WMC) that is servicing the call that a handoff is desired (page 6 sections 0053, 0054);

the source MSC analyzing the message, establishing itself as an anchor MSC (WMC) (page 6 section 0054), and establishing communication channels with a target MSC servicing a geographic WWAN area in which the mobile station resides (page 6 section 0054, 0055);

the mobile station beginning communication with the WWAN and the target MSC relaying those communication to the anchor MSC (page 6 sections 0056).

Regarding claim 10, Kallio teaches a method wherein the mobile station informs the MSC (WMC) serving the WLAN of the cell ids of the WWAN geographic area (page 5 section 0054), and wherein the source MSC uses the cell ids information to establish communication channels with the target MSC (page 6 section 0056).

3. Claims 7, 11, are rejected under 35 U.S.C. 103(a) as being unpatentable over Kallio (US Patent Number 2002/0147008 A1) in view Bridgelall (US Publication 2002/0085516 A1) in further view of Chaney et al. (US Publication 2003/0108000 A1).

Regarding claim 7, Kallio teaches a method wherein the mobile stations sends via a WLAN air interface protocol a handoff request message as an overloaded SIP command and the WLAN communicates the handoff request message to the target MSC (page 4 section 0033). Kallio teaches a method of handoff from WWAN to WLAN

and vise versa utilizing session Initiation Protocol (SIP) control signaling for call set-up and call control (page 4 section 0033). Kallio modified by Bridgelall fails to teach the Handoff request is an overload SIP command. However Chaney teaches a system and method of providing a subscriber service to service users in a telecommunications network. In networks utilizing Session Initiation Protocol (SIP) control signaling for call setup and control, the SIP REGISTER message is modified to indicate service capability information and optionally a traffic load indication for service providers (page 3 sections 0032, 0036 and abstract). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to combine the above teaching Chaney with Kallio modified by Bridgelall, in order to prevent congestion by notifying the system of overload and invite one system to handoff to other.

Regarding claim 11, Kallio teaches a method of handoff from WWAN to WLAN and vise versa utilizing session Initiation Protocol (SIP) control signaling for call set-up and call control (page 4 section 0033). Kallio modified by Bridgelall fails to teach the Handoff request is an overload SIP command. However Chaney teaches a system and method of providing a subscriber service to service users in a telecommunications network. In networks utilizing Session Initiation Protocol (SIP) control signaling for call setup and control, the SIP REGISTER message is modified to indicate service capability information and optionally a traffic load indication for service providers (page 3 sections 0032, 0036 and abstract). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to combine the above teaching

Chaney with Kallio modified by Bridgelall, in order to prevent congestion by notifying the system of overload and invite one system to handoff to other.

Claim 12, is rejected under 35 U.S.C. 103(a) as being unpatentable over Kallio
 (US Patent Number 2002/0147008 A1) in view Bridgelall (US Publication 2002/0085516
 A1) in further of view Yukie (US Patent Number 2002/0036392 A1).

Regarding claim 12, Kallio teaches a method wherein a mobile station determines that it should communicate according to a WWAN air interface protocol while the mobile station is participating in a call under a WLAN air interface protocol (Page 5 sections 0040, 0042), and further Kallio teaches VLR may be used to hold temporary information about active subscribers that are operating within the control of that particular MSC (page 3 section 0026).

Kallio fails to explain the procedures of handoff using the temporary number. However, Yukie teaches the step of in response to sending a message to a source MSC to request a temporary local directory number (TLDN) the source MSC providing a TLDN to the mobile station;

the source MSC causing a called party of the call to be placed on hold and the mobile station requests a call to be made using the TLDN as a called party;

the WWAN causing call connections to be made connecting the mobile station with the TLDN to resume the call (page 6 section 0059). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to combine the above

teaching of Yukie with Kallio modified by Bridgelall, in order to provide a system with higher information transfer rate, by transferring data to mobile unit automatically through a wireless package switched network and a wireless circuit switch network, without any interruption.

Response to Arguments

5. Applicant's arguments with respect to claims 1-13 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

6. Any responses to this action should be mailed to:

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Naghmeh Mehrpour whose telephone number is 571-272-7913. The examiner can normally be reached on 8:00-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Marsha Banks-Harold be reached (571) 272-7905.

The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
